Restoration and Refinement

Sep 19, 2015 - Dubai: More than three million people in the **UAE** suffer from **acid reflux**

UAE Today

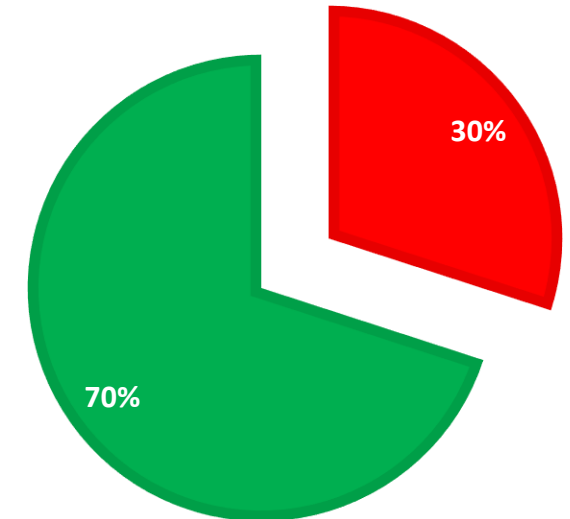

Emirates Gastroenterology Society has revealed that the UAE is in the list of countries that are severely affected by the Gastroesophageal Reflux Disease (GERD). The incidence of this disease has increased rapidly in the past few years

ESOPOLE is a proton pump inhibitor that decreases the amount of acid produced in the stomach.

ESOPOLE well established as a treatment of Gastroesophageal reflux disease (GERD), Gastric ulcers, Helicobacter pylori infection, Peptic ulcer, Zollinger-ellison syndrome and NSAID associated Ulcers .

Esomeprazole 40 mg VS Omeprazole 40

Maintenance of intragastrical pH > 4 is vital for effective management of gastroesophageal reflux disease (GERD). Esomeprazole 40 mg, the first proton pump inhibitor developed as an optical isomer, demonstrates improved acid inhibition over omeprazole 20 mg. Our aim was to compare esomeprazole 40 mg with omeprazole 40 mg, once-daily, on intragastrical acidity in patients with symptoms of GERD. In this open-label, crossover study, 130 patients with symptoms of GERD received esomeprazole 40 mg or omeprazole 40 mg once-daily for five days. The 24-hr intragastrical pH was monitored on days 1 and 5 of each treatment period.

In conclusion, esomeprazole 40 mg provides more effective acid control than twice the standard dose of omeprazole.
